

Question:

James decides to run 3 sprints 3 times a week. He runs 60 meters each sprint. How many total meters does he run a week?

Reasoning + Answer:

<think>
the total number of sprints per week = number of sprints per session * number of sessions per week
so, $3 * 3 = 9$ sprints per week
the total distance covered in every sprint = 60 meters
total distance covered in a week = number of sprints per week * distance per sprint
or, $9 * 60 = 540$ meters
</think>
<answer>
540 </answer>
