

Question:

Every day, Wendi feeds each of her chickens three cups of mixed chicken feed, containing seeds, mealworms and vegetables to help keep them healthy. She gives the chickens their feed in three separate meals. In the morning, she gives her flock of chickens 15 cups of feed. In the afternoon, she gives her chickens another 25 cups of feed. How many cups of feed does she need to give her chickens in the final meal of the day if the size of Wendi's flock is 20 chickens?

Reasoning + Answer:

<think>
Wendi feeds each of her 20 chickens 3 cups of feed per day . In the morning , she gives each chicken 1 . 5 cups (15 cups total / 10 chickens), and in the afternoon , she feeds each chicken 2 . 5 cups (25 cups total / 10 chickens), totaling 17 . 5 cups . The remaining feed is the total feed per day minus the morning and afternoon feeds . The total feed for all chickens per day is 60 cups (20 chickens * 3 cups / each). The remaining feed to be given in the final meal would be 42 . 5 cups (60 cups - 17 . 5 cups).
</think>
<answer>42 . 5</answer>
