

Question:

Every day, Wendi feeds each of her chickens three cups of mixed chicken feed, containing seeds, mealworms and vegetables to help keep them healthy. She gives the chickens their feed in three separate meals. In the morning, she gives her flock of chickens 15 cups of feed. In the afternoon, she gives her chickens another 25 cups of feed. How many cups of feed does she need to give her chickens in the final meal of the day if the size of Wendi's flock is 20 chickens?

Reasoning + Answer:

<think>
Wendi gives the first meal 15 cups of feed and the second meal 25 cups of feed in the morning and the afternoon .
The sum of the first two meals is <think>
 $15 + 25 = 40$
</think>cups of feed .
Wendi has 20 chickens and she gives them 3 cups of feed per chicken .
The total amount of feed Wendi needs for all her chickens is <think>
 $3 * 20 = 60$
</think> cups .
She needs to subtract the sum of the first two meals from the total amount of feed for all the chickens to find how much feed is needed for the final meal .
<think>
 $60 - 40 = 20$
</think>
The final meal of the day requires 20 cups of feed .
<answer>
20 </answer>
