

Question:

James decides to run 3 sprints 3 times a week. He runs 60 meters each sprint. How many total meters does he run a week?

Reasoning + Answer:

<think> <think> firstly i want to find out how many total meters he runs in one week , so to do this i must add the 3 sprints to find out how many sprints are there in a week , i.e. $3 * 3 = 9$ sprints ; then i multiply the total sprints (9) by the distance of each sprint (60) to get the total distance covered , i.e. $9 * 60 = 540$; now i know that jame runs a total of 540 meters in a week ; </think> <answer> 540
</answer> </think>
