

Question:

Every day, Wendi feeds each of her chickens three cups of mixed chicken feed, containing seeds, mealworms and vegetables to help keep them healthy. She gives the chickens their feed in three separate meals. In the morning, she gives her flock of chickens 15 cups of feed. In the afternoon, she gives her chickens another 25 cups of feed. How many cups of feed does she need to give her chickens in the final meal of the day if the size of Wendi's flock is 20 chickens?

Reasoning + Answer:

<think> <think> firstly i have to find out total feed i have given to chickens in the day and then i have to divide it by the total number of the chickens in the flock in order to find out the feed in one meal ; now for doing that i have to add the 25 cups of feed she give the flock in the afternoon to the 15 cups of feed she give the flock in the morning and then add it to the feed she will give to her flock in the final meal ; now i have to divide the total feed i have given to the flock till now by the total number of the chickens in the flock to find out the feed in one meal ; so i have to start with the first step and add the feed given in the morning and in the afternoon ; now the total feed she has given to her flock in the morning and the afternoon is $15 + 25 = 40$ cups ; now i have to add the feed in the final meal which i have to find out ; so the total feed she has given to her flock in the day is $40 + x$; now i have to divide this total feed by the total number of the chickens in the flock ; the total feed is $40 + x$ and the total number of the chickens in the flock is 20 ; so $40 + x / 20 = 3$; now $40 + x = 60$; so $x = 20$; </think> </think><answer>20 </answer>
