

Question:

Kylar went to the store to buy glasses for his new apartment. One glass costs \$5, but every second glass costs only 60% of the price. Kylar wants to buy 16 glasses. How much does he need to pay for them?

Reasoning + Answer:

<think>
the cost of one glass is 5
For the glasses that cost only 60% the price of 5, the total for every second glass is $0.6 * 5 = 3$
the total number of glass is 16
then how many pair of glass does Kylar wants to buy is $16 / 2 = 8$
the price of these glasses is $8 * 3 = 24$
And the rest 8 glasses have the total price of $8 * 5 = 40$
thus the total price Kylar needs to pay is $24 + 40$
</think>
<answer>
64 </answer>
