

Question:

Every day, Wendi feeds each of her chickens three cups of mixed chicken feed, containing seeds, mealworms and vegetables to help keep them healthy. She gives the chickens their feed in three separate meals. In the morning, she gives her flock of chickens 15 cups of feed. In the afternoon, she gives her chickens another 25 cups of feed. How many cups of feed does she need to give her chickens in the final meal of the day if the size of Wendi's flock is 20 chickens?

Reasoning + Answer:

<think>

She gives 15 cups of feed in the morning and 25 cups in the afternoon . This comes to $15 + 25 = 40$ cups of feed . She has 20 chickens in her flock and they each eat 3 cups of food a day . This means she needs to provide $20 * 3 = 60$ cups of feed a day . If she has already provided 40 cups of feed during the morning and afternoon she needs to provide $60 - 40 = 20$ cups of feed in the evening .

</think>

<answer> 20 </answer>
