

Question:
Kylar went to the store to buy glasses for his new apartment. One glass costs \$5, but every second glass costs only 60% of the price. Kylar wants to buy 16 glasses. How much does he need to pay for them?

Reasoning + Answer:

Let's break down the problem step by step .

1 . ****Identify the cost of the first and second glasses : ****

- The first glass costs \$ 5 .

- The second glass costs 60% of \$ 5 . So , the cost of the second glass is :

$$\begin{aligned} & \backslash[\\ & 5 \times 0.60 = 3 \text{ dollars } \\ & \backslash] \end{aligned}$$

2 . ****Calculate the total cost for 16 glasses : ****

- Kylar buys glasses in pairs (one at \$ 5 and the second at \$ 3).

- So , for every pair of glasses , the total cost is :

$$\begin{aligned} & \backslash[\\ & 5 + 3 = 8 \text{ dollars } \\ & \backslash] \end{aligned}$$

- Since Kylar is buying 16 glasses , he is buying 8 pairs of glasses .

- The total cost for 8 pairs of glasses is :

$$\begin{aligned} & \backslash[\\ & 8 \times 8 = 64 \text{ dollars } \\ & \backslash] \end{aligned}$$

So , the total amount Kylar needs to pay for 16 glasses is \$ 64 .

<think>

- Kylar buys glasses in pairs (one at \$ 5 and the second at \$ 3).

- The cost for each pair is \$ 8 .

- He buys 8 pairs , so the total cost is \$ 64 .

</think>

<answer> 64 </answer>
