

Question:

A 34-year-old woman presents to her OB/GYN with complaints of missing her last 3 periods as well as intermittent spontaneous milky-white nipple discharge bilaterally for the past 3 months. Vital signs are stable and within normal limits. Neurologic examination is without abnormality, including normal visual fields. Serology and MRI of the brain are ordered, with results pending. Which of the following sets of laboratory results would be expected in this patient?

Answer Choices:

- A. Decreased prolactin, decreased FSH, decreased LH
- B. Decreased prolactin, increased FSH, increased LH
- C. Increased prolactin, decreased FSH, increased LH
- D. Increased prolactin, decreased FSH, decreased LH

Reasoning + Answer:

<think> Reasoning process : The patient presents with symptoms of amenorrhea (missing last three periods) and galactorrhea (milky-white nipple discharge), which are classic symptoms of hyperprolactinemia , a condition characterized by elevated levels of prolactin . This can cause the pituitary gland to secrete abnormal amounts of prolactin . The patient's normal neurologic examination , including normal visual fields , suggests that the pituitary adenomas or malignancies are ruled out as potential causes of the symptoms . Reduced uterine size on the MRI is also found . </think><answer> D . Increased prolactin , decreased FSH , decreased LH </answer>
