

Question:
At birth, the least developed part of the brain is the

Answer Choices:

- A. visual system
- B. thalamus
- C. frontal lobe
- D. brain stem
- E. parietal lobe
- F. cerebellum
- G. cortex
- H. basal ganglia
- I. hypothalamus
- J. limbic system

Reasoning + Answer:

<think>

the brain develops in stages , with the least developed part at birth being the cortex , which is responsible for higher-level thinking , decision-making , and complex behaviors .

the pre frontal cortex , a part of the cortex , is particularly immature at birth , and continues to develop throughout childhood and adolescence .

the other options are either more developed at birth or are critical for basic functions that are present at birth .

the visual system is relatively well-developed at birth , allowing newborns to detect light and respond to visual stimuli .

the brain stem and hypothalamus control basic life functions such as breathing , heart rate , and body temperature , and are more developed at birth .

the basal ganglia and thalamus are also more developed at birth , playing roles in movement control and sensory processing , respectively .

the limbic system , which includes the hippocampus and amygdala , is more developed at birth , involved in emotions , motivation , and memory .

the parietal lobe , involved in spatial awareness and processing , is also more developed at birth .

the cerebellum , responsible for motor coordination and balance , is more developed at birth .

the cortex , specifically the pre frontal cortex , is the least developed part of the brain at birth .

</think>

<answer> G . cortex </answer>
