

Question:

What is the de Broglie wavelength of an electron with a kineticenergy of 1eV?

Answer Choices:

- A. 2.48×10^{-8} cm
- B. 5.92×10^7 cm/sec
- C. 8.66×10^{-6} cm
- D. 3.14×10^{-5} cm
- E. 9.81×10^{-4} cm
- F. 5.27×10^{-9} m
- G. 1.23×10^{-7} cm
- H. 4.14×10^{-10} m
- I. 6.625×10^{-27} erg sec
- J. 0.512×10^6 eV

Reasoning + Answer:

<think>

the de Broglie wavelength of a particle can be calculated using the formula $\lambda = h / \sqrt{2 m E}$, where λ is the de Broglie wavelength , h is the Planck constant , m is the mass of the particle , and E is its kinetic energy .

First , convert the kinetic energy from eV to Joules . $1 \text{ eV} = 1.602 \times 10^{-19} \text{ J}$. So the kinetic energy is $1.602 \times 10^{-19} \text{ J}$.

The mass of an electron is approximately $9.11 \times 10^{-31} \text{ kg}$.

The Planck constant is approximately $6.626 \times 10^{-34} \text{ J s}$.

Now we can plug in the values into the formula to get $\lambda = (6.626 \times 10^{-34}) / \sqrt{ 2 * 9.11 \times 10^{-31} * 1.602 \times 10^{-19} } = (6.626 \times 10^{-34}) / \sqrt{ 2 * 9.11 \times 10^{-31} * 1.602 \times 10^{-19} }$

Simplify the expression to find the de Broglie wavelength .

Then convert the wavelength to cm and check the answer choice options .

</think><answer> B. 5.92×10^7 cm </answer>
