

Question:

Every day, Wendi feeds each of her chickens three cups of mixed chicken feed, containing seeds, mealworms and vegetables to help keep them healthy. She gives the chickens their feed in three separate meals. In the morning, she gives her flock of chickens 15 cups of feed. In the afternoon, she gives her chickens another 25 cups of feed. How many cups of feed does she need to give her chickens in the final meal of the day if the size of Wendi's flock is 20 chickens?

Reasoning + Answer:

<think> Okay , Wendi feeds each of her chickens 3 cups of feed , and there are 20 chickens in her flock , so the total number of cups of feed she needs to give is $3 * 20 = 60$ cups . So far , she has given the chickens $15 + 25 = 40$ cups of feed . To find out how many cups of feed she needs for the final meal , I need to subtract the cups of feed she has already given from the total number of cups of feed , which is $60 - 40 = 20$ cups </think><answer> 20 </answer>
