

Question:

Kylar went to the store to buy glasses for his new apartment. One glass costs \$5, but every second glass costs only 60% of the price. Kylar wants to buy 16 glasses. How much does he need to pay for them?

Reasoning + Answer:

<think> Okay , Kylar is buying glasses , one costs \$ 5 , but every second glass costs 60 % of that , which is \$ 3 . So for every 2 glasses , Kylar is paying \$ 5 + \$ 3 = \$ 8 . He wants to buy 16 glasses . We need to find out how many groups of 2 glasses are there in 16 glasses . $16 / 2 = 8$ groups . Since each group costs \$ 8 , we multiply the number of groups by the cost per group , $8 * \$ 8 = \$ 64$. So , Kylar needs to pay \$ 64 for 16 glasses .</think><answer> 64 </answer>
