

Question:

Kylar went to the store to buy glasses for his new apartment. One glass costs \$5, but every second glass costs only 60% of the price. Kylar wants to buy 16 glasses. How much does he need to pay for them?

Reasoning + Answer:

<think> Okay , so Kylar wants to buy 16 glasses , one of which costs \$ 5 , and the other costs 60 % of that , which is $0.6 * \$5 = \3 . To find the total cost , I will need to calculate the total cost of glasses at the regular price , which is 15 glasses at \$ 5 each , that is $15 * \$5 = \75 . Then , I need to calculate the cost of glasses at the discount , which is 1 glass at \$ 3 , that is \$ 3 . The total amount is calculated by adding the regular and the discount . So is <answer> $\$75 + \$3 = \$78$ </answer>
