

Question:

James decides to run 3 sprints 3 times a week. He runs 60 meters each sprint. How many total meters does he run a week?

Reasoning + Answer:

<think> Okay , if James runs 3 sprints per session and he does this 3 times a week , that's $3 \times 3 = 9$ sprints per week . Each sprint is 60 meters , so we need to multiply the number of sprints by the distance per sprint , which is $9 \times 60 = 540$. So , James runs 540 meters per week .</think><answer>540</answer>
