

Question:

Kylar went to the store to buy glasses for his new apartment. One glass costs \$5, but every second glass costs only 60% of the price. Kylar wants to buy 16 glasses. How much does he need to pay for them?

Reasoning + Answer:

<think> Okay , if one glass costs \$ 5 and every second glass costs 60 % of the price of the first glass , that means every second glass costs $\$ 5 * 0.6 = \$ 3$. Kylar is buying 16 glasses , so the first 8 glasses will cost $8 * \$ 5 = \$ 40$. The next 8 glasses will cost $8 * \$ 3 = \$ 24$. The total cost will be $\$ 40 + \$ 24 = \$ 64$. So , Kylar needs to pay \$ 64 to buy the glasses.</think><answer>64</answer>
