

Question:

Josh decides to try flipping a house. He buys a house for \$80,000 and then puts in \$50,000 in repairs. This increased the value of the house by 150%. How much profit did he make?

Reasoning + Answer:

<think> Let's break down the problem step by step. Josh buys a house for \$80,000 and spends \$50,000 on repairs, making the total cost \$130,000. Then, the value of the house increased by 150% of its original price after the repairs. To find the new value, we need to calculate 150% of \$80,000, which is $1.5 * \$80,000 = \$120,000$. Now, we add the increase to the original price: $\$80,000 + \$120,000 = \$200,000$. This is the new value of the house. To find the profit, we subtract the total cost from the new value: $\$200,000 - \$130,000 = \$70,000$. So, Josh made a profit of \$70,000.</think><answer> 70000 </answer>
