

Question:
James decides to run 3 sprints 3 times a week. He runs 60 meters each sprint. How many total meters does he run a week?

Reasoning + Answer:

<think>
To find the total meters James runs in a week , we first need to determine how many meters he runs in one sprint . Since he runs 60 meters per sprint , we can multiply this by the number of sprints he does in a week . James runs 3 sprints per week , so we multiply 60 meters by 3 to get 180 meters per week . Alternatively , we can calculate similarly multiply words > Itself milliseconds)) .
