

Question:

Josh decides to try flipping a house. He buys a house for \$80,000 and then puts in \$50,000 in repairs. This increased the value of the house by 150%. How much profit did he make?

Reasoning + Answer:

<think> <think> the initial value of the house is <think> 80000 </think> <think> and the added value, which is 150% of the initial value, is <think> $80000 \times (150/100) = 120000$ </think> <think> so the new value of the house will be the initial value + added value which is <think> $80000 + 120000 = 200000$ </think> <think> the total house investment is the initial value + repairs done, which is <think> $80000 + 50000 = 130000$ </think> <think> to calculate the profit he has made, we subtract the total investment from the new value of the house, that is <think> $200000 - 130000 = 70000$ </think> </think> </think> </think> <answer> 70000 </answer>
