

Question:

Every day, Wendi feeds each of her chickens three cups of mixed chicken feed, containing seeds, mealworms and vegetables to help keep them healthy. She gives the chickens their feed in three separate meals. In the morning, she gives her flock of chickens 15 cups of feed. In the afternoon, she gives her chickens another 25 cups of feed. How many cups of feed does she need to give her chickens in the final meal of the day if the size of Wendi's flock is 20 chickens?

Reasoning + Answer:

<think> <think> from the information given Wendi gives 15 cups in the morning and 25 cups in the afternoon , and for every day she gives 3 cups in one meal to each of her 20 chickens , we can calculate the total by first adding the total cups of feed from the morning and afternoon , and then subtracting that total from the cup of feed given per chicken per day for each of her 20 chickens <think> feeding in the morning and afternoon amounts to <think> $15 + 25 = 40$ cups <think> as mentioned , she feeds every chicken 3 cups per meal , per chicken per day , so for 20 chickens that becomes $3 * 20 = 60$ cups <think> when we subtract the amount of feed given in the first two meals (40) from the amount given in a day to every chicken (60) we'll have <think> $60 - 40 = 20$ cups <think> so the final feed in the day should be 20 cups </think> >
<answer> 20 cups </answer>
