

Question:

Every day, Wendi feeds each of her chickens three cups of mixed chicken feed, containing seeds, mealworms and vegetables to help keep them healthy. She gives the chickens their feed in three separate meals. In the morning, she gives her flock of chickens 15 cups of feed. In the afternoon, she gives her chickens another 25 cups of feed. How many cups of feed does she need to give her chickens in the final meal of the day if the size of Wendi's flock is 20 chickens?

Reasoning + Answer:

<think> the total amount of feed is the amount given in the morning and in the afternoon so <think>
 $15 + 25 = 40$ </think> </think>, and the amount of feed per chicken per day is <think> $40 / 20 = 2$
</think> cups; since she feeds each of her chickens three cups of feed every day, that means she
wants to give the 20 chickens $3 \times 20 = 60$ cups in total. We already know that in the morning and
afternoon, she has fed 40 cups, and that leaves <think> $60 - 40 = 20$ </think> cups for the evening
. </think>
<answer> 20 </answer>
