

Question:

Every day, Wendi feeds each of her chickens three cups of mixed chicken feed, containing seeds, mealworms and vegetables to help keep them healthy. She gives the chickens their feed in three separate meals. In the morning, she gives her flock of chickens 15 cups of feed. In the afternoon, she gives her chickens another 25 cups of feed. How many cups of feed does she need to give her chickens in the final meal of the day if the size of Wendi's flock is 20 chickens?

Reasoning + Answer:

<think> the total amount of feed she has given <think> = 15 cups + 25 cups <think> = 40 cups <think> If 40 cups of feed are given to 20 chickens , the amount per chicken is <think> 40 cups / 20 chickens <think> = 2 cups per chicken <think> In the final meal , she needs to feed a total of 3 meals * 2 cups for a flock of 20 chickens which is 6 cups <think> If there's a flock of 20 , and each one gets 2 cups per meal , the final meal for 20 should be 3 meals * 20 chickens = 60 cups <think> At the end , 60 cups of feed she gives to her flock in the final meal of the day <answer> 60 </answer>
