

Question:

Kylar went to the store to buy glasses for his new apartment. One glass costs \$5, but every second glass costs only 60% of the price. Kylar wants to buy 16 glasses. How much does he need to pay for them?

Reasoning + Answer:

<think>Kylar buys 16 glasses. That means he is buying 2 groups of one pair of glasses (8 glasses each). In the first pair , 4 glasses cost \$5 each and in the second pair , the cost is 60 % of the price of \$5 . We need to find the total cost first for the glasses that cost \$5 and then for those at 60 % price which amount to 4 glasses . Lastly , we sum up these two parts to get the final answer.</think>
<answer>\$80</answer>
