

Question:

James decides to run 3 sprints 3 times a week. He runs 60 meters each sprint. How many total meters does he run a week?

Reasoning + Answer:

<think>

James runs 3 sprints each week and since each sprint is 60 meters long, the total meters run in a week from running 3 sprints is $3 * 60 = 180$ meters.

The number of times he runs these sprints is 3, and from all those sprints, he runs 180 meters, so the total meters run in a week is $180 * 3 = 540$.

</think>

<answer>540</answer>
