

Question:

Every day, Wendi feeds each of her chickens three cups of mixed chicken feed, containing seeds, mealworms and vegetables to help keep them healthy. She gives the chickens their feed in three separate meals. In the morning, she gives her flock of chickens 15 cups of feed. In the afternoon, she gives her chickens another 25 cups of feed. How many cups of feed does she need to give her chickens in the final meal of the day if the size of Wendi's flock is 20 chickens?

Reasoning + Answer:

<think>
The total amount of feed given in the morning and afternoon is $15 + 25 = 40$ cups.
If Wendi has 20 chickens and each requires three cups, the total amount of feed needed per day is $20 * 3 = 60$ cups.
The remaining amount for the final meal is $60 - 40 = 20$ cups.
To find the amount of feed per chicken, we divide the remaining total feed by the number of chickens for the final meal, which is $20 / 20 = 1$ cup per chicken.
Therefore, the total feed needed for the final meal is $1 * 20 = 20$ cups for 20 chickens.
</think>
<answer>20</answer>
