

Question:

James decides to run 3 sprints 3 times a week. He runs 60 meters each sprint. How many total meters does he run a week?

Reasoning + Answer:

<think>

James runs 3 sprints a week, and since each sprint is 60 meters, running the same 3 sprints 3 times means $3 * 60 = 180$ meters a week.

Because he runs the 3 sprints 3 times a week, it means running $180 * 3 = 540$ meters per week.

</think>

<answer>

540 meters</answer>
