

Question:
Every day, Wendi feeds each of her chickens three cups of mixed chicken feed, containing seeds, mealworms and vegetables to help keep them healthy. She gives the chickens their feed in three separate meals. In the morning, she gives her flock of chickens 15 cups of feed. In the afternoon, she gives her chickens another 25 cups of feed. How many cups of feed does she need to give her chickens in the final meal of the day if the size of Wendi's flock is 20 chickens?

Reasoning + Answer:

`<think>`
In the morning , Wendi gives 15 cups to one chicken , so in the day the total amount of feed in the morning is $15 * 20$. In the afternoon , 25 cups are given to another chicken , so total feed in the afternoon is $25 * 20$. The total amount of feed given by Wendi in the first 2 meals is the sum of what was given in the morning and afternoon . The number of cups in the last meal is the total feed for the day minus the feed given in the first 2 meals .

`</think>`
`<answer>`
200
