

Question:

Kylar went to the store to buy glasses for his new apartment. One glass costs \$5, but every second glass costs only 60% of the price. Kylar wants to buy 16 glasses. How much does he need to pay for them?

Reasoning + Answer:

<think>The first glass costs \$5. The second glass, which costs only 60% of the price, is <think> $5 * 0.60 = 3$ </think>. So, every pair of glasses costs <think> $5 + 3 = 8$ </think>. Since Kylar wants to buy 16 glasses, he needs 8 pairs. Thus, the total cost for the glasses is <think> $8 * 8 = 64$ </think>.
</think><answer>64</answer>
