

Question:

Every day, Wendi feeds each of her chickens three cups of mixed chicken feed, containing seeds, mealworms and vegetables to help keep them healthy. She gives the chickens their feed in three separate meals. In the morning, she gives her flock of chickens 15 cups of feed. In the afternoon, she gives her chickens another 25 cups of feed. How many cups of feed does she need to give her chickens in the final meal of the day if the size of Wendi's flock is 20 chickens?

Reasoning + Answer:

`<think>`The feed for the three meals is $15 + 25 = 40$ cups. After these three feedings, 40 cups of feed are left to feed the remaining 5 chickens because the total flock is 20 and $15 + 25$ feedings were done. So, $40 - 5 = 35$ cups of feed are left for the last feeding. So, the last feeding of feed has $35 / 5 = 7$ cups because each chicken needs 3 cups. `</think>`
`<answer>` 7 `</answer>`
