

Question:

Kylar went to the store to buy glasses for his new apartment. One glass costs \$5, but every second glass costs only 60% of the price. Kylar wants to buy 16 glasses. How much does he need to pay for them?

Reasoning + Answer:

<think>The first glass costs \$5 , the second glass costs $5 * 0.6 = \$3$, the third costs \$5 , and the fourth costs $\$5 * 0.6 = \3 and so on... <think>

<think>Kylar wanted to buy 16 glasses and so : $2 + 4 + 6 + 8 + 10 + 12 + 14 = 60$ <think>

<think> There are 10 numbers in the sequence and they add up to 60 .<think>

<think> 60 glasses will cost $60 * 5 = \$300$ <think>

<think>The 2nd glass costs \$3 , the 4th costs \$3 , the 6th costs \$3 and so on until <think> 14th glass <think> Which would cost $2 * 2 = \$4$ in total .<think>

<think>The total cost is therefore $\$300 + \$4 = \$304$ <answer>\$304 </answer>
