

Question:

James decides to run 3 sprints 3 times a week. He runs 60 meters each sprint. How many total meters does he run a week?

Reasoning + Answer:

<think>

James runs 3 sprints per session and 3 sessions per week . So the total number of sprints he runs in a week would be <think> $3 \text{ sprints/session} * 3 \text{ sessions/week} = 9 \text{ sprints/week}$ </think>. Since each sprint is 60 meters , the total distance he runs in a week would be <think> $9 \text{ sprints/week} * 60 \text{ meters/sprint} = 540 \text{ meters/week}$ </think>. Therefore , he runs 540 meters every week .

</think>

<answer>540</answer>
