

Question:

Josh decides to try flipping a house. He buys a house for \$80,000 and then puts in \$50,000 in repairs. This increased the value of the house by 150%. How much profit did he make?

Reasoning + Answer:

<think>

The initial cost of the house was \$80,000. Josh put in \$50,000 in repairs, so the total amount spent was \$80,000 (initial cost) + \$50,000 (repairs) = \$130,000. This investment increased the value of the house by 150%, which means the value increase is 150% of the total investment, so the value increase is $1.5 * \$130,000 = \$195,000$. Therefore, the final value of the house after the investment is $\$130,000$ (cost) + $\$195,000$ (value increase) = $\$325,000$.

Now, to determine the profit, we subtract the total cost from the final value, which is $\$325,000$ (final value) - $\$130,000$ (total cost) = $\$195,000$.

</think>

<answer>

\$195,000

</answer>
