

Question:

Josh decides to try flipping a house. He buys a house for \$80,000 and then puts in \$50,000 in repairs. This increased the value of the house by 150%. How much profit did he make?

Reasoning + Answer:

<think>
The increased value of the house is calculated as 150% of the original value , which is <think>
 $(80000 * 150 / 100) = 120000$
</think>
So the new total value of the house becomes <think>
 $120000 + 80000 = 200000$
</think>
The total amount Josh spent on buying the house and the repairs is <think>
 $80000 \text{ (original price)} + 50000 \text{ (repairs)} = 130000$
</think>
So , the profit he made is <think>
 $200000 \text{ (new total value)} - 130000 \text{ (total spent)} = 70000$
</think>
Therefore , the profit Josh made is <answer>70000</answer>.
