

Question:

Every day, Wendi feeds each of her chickens three cups of mixed chicken feed, containing seeds, mealworms and vegetables to help keep them healthy. She gives the chickens their feed in three separate meals. In the morning, she gives her flock of chickens 15 cups of feed. In the afternoon, she gives her chickens another 25 cups of feed. How many cups of feed does she need to give her chickens in the final meal of the day if the size of Wendi's flock is 20 chickens?

Reasoning + Answer:

<think>
We start by adding the daily total for the first two meals , which is 15 cups in the morning plus 25 cups in the afternoon giving 40 cups .
Given that there are 20 chickens , we divide this total by the number of chickens , so <think> 40 / 20
</think> resulting in 2 cups .
Knowing that the chickens get 3 cups of feed each day , the 3 cups minus the amount each chicken gets from the first two meals is <think> 3 - 2 </think> 1 cup which is the amount each chicken will get from the last meal .
Finally , the last meal then for every chicken is the same , hence the total , for 20 chickens , is <think>
1 * 20 </think> 20 cups .
</think>
<answer> 20 </answer>
