

Question:

James decides to run 3 sprints 3 times a week. He runs 60 meters each sprint. How many total meters does he run a week?

Reasoning + Answer:

<think> <think> first i need to determine the total meters james runs in a week so i will do this by getting the total meters he run in a week which is 3 sprints times 3 times a week so $3 * 3 = 9$; then i will add the total meters he run in a week to the total number of sprints he does in a week which is 9 ; then i need to determine the total meters he run in a sprint which is 60 so i will multiply 9*sprints to 60 meters which is $9 * 60 = 540$; there fore the total meters he run in a week is 540 </think> </think><answer> 540 </answer>
