

Question:

Josh decides to try flipping a house. He buys a house for \$80,000 and then puts in \$50,000 in repairs. This increased the value of the house by 150%. How much profit did he make?

Reasoning + Answer:

<think> <think> first, i am understanding the initial cost which is the price of the house plus the amount spent on repairs, which is $80,000 + 50,000 = 130,000$, then i know that the house price increased by 150% which is 150% of 130,000 which is $1.5 * 130,000$ and the total increase is $130,000 + 150\% \text{ of } 130,000 = 130,000 + 195,000 = 325,000$, now, to get the profit i am required to subtract the initial cost of 130,000 from the final value of the house, which is $325,000 - 130,000 = 295,000$, therefore, he got the profit of 295,000 </think> <answer> 295,000 </answer> </think>
