

Question:

James decides to run 3 sprints 3 times a week. He runs 60 meters each sprint. How many total meters does he run a week?

Reasoning + Answer:

<think> <think> firstly to get total the meters run per week , the we have to convert all the information into equation form to get the total distances James runs weekly ; he ran 3 times per week , 3 sprints for every run , and every sprint he runs 60 meters ; so , i will find total meters per run , total run per week , and after that i will find the total distance ; total meters for 1 st run = 3 sprints * 60 meters per sprint ; total run for the week 3 run for every week ; total meters per week = 3 runs * total meters for 1 st run ; to get the total i will multiply the total meters per run with the run per week </think> <answer> (3 sprints * 60 meters per sprint) * 3 runs for the week ; 90 meters * 3 = 270 meters total </answer> </think>
