

Question:

Kylar went to the store to buy glasses for his new apartment. One glass costs \$5, but every second glass costs only 60% of the price. Kylar wants to buy 16 glasses. How much does he need to pay for them?

Reasoning + Answer:

<think>The total cost of glasses can be calculated by dividing the number of glasses into two groups: ones that cost \$5 each and ones that cost <think> $5 * 0.6 = 3$ </think>. Thus, <think> $5 + 3 = 8$ </think> is the price for every two glasses. Kylar wants 16 glasses which is <think> $16 / 2 = 8$ </think> > sets of two glasses, so the total cost is <think> $8 * 8 = 64$ </think>. </think><answer>64</answer>
