

Question:

James decides to run 3 sprints 3 times a week. He runs 60 meters each sprint. How many total meters does he run a week?

Reasoning + Answer:

<think>The total meters James runs per week can be computed by finding out his weekly meters per sprint and then multiply it by his number of sprints. Thus, with 3 sprints a week and running 60 meters in each sprint, he covers $3 * 60 = 180$ meters per week. </think><answer>180</answer>
