

Question:

Every day, Wendi feeds each of her chickens three cups of mixed chicken feed, containing seeds, mealworms and vegetables to help keep them healthy. She gives the chickens their feed in three separate meals. In the morning, she gives her flock of chickens 15 cups of feed. In the afternoon, she gives her chickens another 25 cups of feed. How many cups of feed does she need to give her chickens in the final meal of the day if the size of Wendi's flock is 20 chickens?

Reasoning + Answer:

<think>The daily requirement for the whole flock is <think> $3 * 15 * 20 / 25 = 36$ </think> cups , since $15 + 25 = 40$ cups per flock per day , and that's $40 / 25$ cup per chicken per day ($36 / 20$ equals 1.8). For the last meal , we must subtract the feed given in the first two meals , which comes to <think> $40 - 15 - 25 = 5$ </think>. As the flock is <think>20</think> in number , therefore , feed required for <think> $5 / 20 = 1 / 4 = 0.25$ </think> of the flock . So , $15 + 25 + 0.25$ equals the total daily feed .</think><answer>15</answer>.</answer>
