

Question:

Every day, Wendi feeds each of her chickens three cups of mixed chicken feed, containing seeds, mealworms and vegetables to help keep them healthy. She gives the chickens their feed in three separate meals. In the morning, she gives her flock of chickens 15 cups of feed. In the afternoon, she gives her chickens another 25 cups of feed. How many cups of feed does she need to give her chickens in the final meal of the day if the size of Wendi's flock is 20 chickens?

Reasoning + Answer:

<think>
the number of cups fed in the morning is 15 , and in the afternoon is 25
the total number of cups of feed Wendi has distributed to her flock till now is $15 + 25 = 40$
the number of chickens in her flock is 20 , and she gives them each three cups
to know how many cups 20 chickens need we multiply 3 by 20 which gives 60
so the quantity of feed required for the final meal is the remaining feed needed which is $60 - 40 = 20$
</think>
<answer> 20 </answer>
