

**Question:**

Kylar went to the store to buy glasses for his new apartment. One glass costs \$5, but every second glass costs only 60% of the price. Kylar wants to buy 16 glasses. How much does he need to pay for them?

**Reasoning + Answer:**

<think>

the cost of one glass is 5

For the glasses that cost only 60% the price of 5, the total for every second glass is  $0.6 * 5 = 3$

the total number of glass is 16

then how many pair of glass does Kylar wants to buy is  $16 / 2 = 8$

the price of these glasses is  $8 * 3 = 24$

And the rest 8 glasses have the total price of  $8 * 5 = 40$

thus the total price Kylar needs to pay is  $24 + 40$

</think>

<answer>

64 </answer>
