

Question:

James decides to run 3 sprints 3 times a week. He runs 60 meters each sprint. How many total meters does he run a week?

Reasoning + Answer:

<think> James runs 3 sprints each time he goes to run. Every week, he runs those sprints 3 times.

First, James runs $3 * 60 = 180$ meters each week. And in a week he runs $3 * 3 = 9$ times. Hence, he will run $9 * 180 = 1620$ meters a week. </think>

<answer>1620</answer>
