

Question:

Every day, Wendi feeds each of her chickens three cups of mixed chicken feed, containing seeds, mealworms and vegetables to help keep them healthy. She gives the chickens their feed in three separate meals. In the morning, she gives her flock of chickens 15 cups of feed. In the afternoon, she gives her chickens another 25 cups of feed. How many cups of feed does she need to give her chickens in the final meal of the day if the size of Wendi's flock is 20 chickens?

Reasoning + Answer:

<think>

Feed given in morning : 15 cups

Feed given in afternoon : 25 cups

Total feed given in morning and afternoon : 15 + 25 = 40 cups

Number of chickens in the flock : 20

Total feed given for all chickens : 20 x 3 = 60 cups

Cups of feed needed for 20 chickens after morning and afternoon feedings :

60 - 40 = 20 cups (so the answer should be a figure fewer than 20 as the flocks are already receiving 40 cups , and only the remaining need is sought)

</think>

<answer> 20 - 40 = 20 </answer> <20> 15 </20> </answer>
