

Question:
Kylar went to the store to buy glasses for his new apartment. One glass costs \$5, but every second glass costs only 60% of the price. Kylar wants to buy 16 glasses. How much does he need to pay for them?

Reasoning + Answer:

Let's break down the problem step by step .

1 . ****Identify the cost of each pair of glasses : ****

- The first glass costs \$ 5 .
- The second glass costs 6 0 % of \$ 5 .
- Calculate 6 0 % of \$ 5 :
$$0.60 \times 5 = 3$$
- Therefore , the second glass costs \$ 3 .
- So , a pair of glasses (first and second glass) costs :

$$5 + 3 = 8 \text{ { dollars } }$$

2 . ****Determine the number of pairs in 16 glasses : ****

- Kylar wants to buy 16 glasses .
- Since each pair consists of 2 glasses , the number of pairs is :

$$\frac{16}{2} = 8 \text{ { pairs } }$$

3 . ****Calculate the total cost for 8 pairs of glasses : ****

- Each pair of glasses costs \$ 8 .
- The total cost for 8 pairs is :

$$8 \times 8 = 64 \text{ { dollars } }$$

<think>
- We identified that every two glasses form a pair with a total cost of \$ 8 .
- Kylar is buying 16 glasses , which form 8 pairs .
- Therefore , the total cost is 8 pairs times \$ 8 per pair .

</think>

< answer > 6 4 </answer>
