

**Question:**  
A robe takes 2 bolts of blue fiber and half that much white fiber. How many bolts in total does it take?

**Reasoning + Answer:**

Let's break down the problem step by step .

1. **\*\*Identify the amount of blue fiber required : \*\***  
- The problem states that a robe takes 2 bolts of blue fiber .

2. **\*\*Determine the amount of white fiber required : \*\***  
- The problem also mentions that the robe takes half as much white fiber as blue fiber .  
- Since 2 bolts of blue fiber are required , half of this amount for the white fiber would be :

$$\begin{aligned} & \left[ \right. \\ & \left. \frac{2}{2} = 1 \text{ bolt} \right] \end{aligned}$$

3. **\*\*Calculate the total amount of fiber required : \*\***  
- We need to sum the bolts of blue fiber and white fiber :  
$$\left[ \begin{aligned} & 2 \text{ (blue fibers)} + 1 \text{ (white fiber)} = 3 \text{ bolts} \end{aligned} \right]$$

**<think>**  
- We have 2 bolts of blue fiber and 1 bolt of white fiber .  
- Therefore , the total number of bolts required is the sum of these two amounts .  
- Summing the bolts : 2 ( blue ) + 1 ( white ) = 3 bolts .  
**</think>**  
**<answer> 3 bolts </answer>**
