

Question:

James decides to run 3 sprints 3 times a week. He runs 60 meters each sprint. How many total meters does he run a week?

Reasoning + Answer:

Let's break down the problem step by step .

1. **Identify the number of sprints James runs per week : **

- James runs 3 sprints each time he exercises .
- He exercises 3 times a week .

2. **Calculate the total number of sprints James runs in a week : **

- Total number of sprints per week = $(3 \text{ sprints/exercise} \times 3 \text{ exercises/week} \backslash)$
- Therefore , $(3 \times 3 = 9 \text{ sprints/week} \backslash)$.

3. **Identify the distance of each sprint : **

- Each sprint is 60 meters .

4. **Calculate the total distance James runs in a week : **

- Total distance per week = $(9 \text{ sprints/week} \times 60 \text{ meters/sprint} \backslash)$
- Therefore , $(9 \times 60 = 540 \text{ meters/week} \backslash)$.

<think >

- James runs 3 sprints each time he exercises .
- He exercises 3 times a week , so the total number of sprints per week is $(3 \times 3 = 9 \backslash)$.
- Each sprint is 60 meters , so the total distance he runs in a week is $(9 \times 60 = 540 \backslash)$ meters .

</think >

<answer >

540 meters

</answer >
