

Question:

A 60-year-old woman is brought to the emergency department because of altered mental status for 2 hours. She and her husband were at the grocery store when she suddenly could not remember why she was there or how she got there. She has not had any head trauma. She has a history of depression and migraines. She does not smoke and drinks a glass of wine each night with dinner. She takes fluoxetine daily. She appears distressed and anxious. Her vital signs are within normal limits. She is fully alert and oriented to self and place but not to time. Every few minutes she asks how she got to the emergency department. She is able to follow commands and sustain attention. She recalls 3/3 objects immediately and recalls 0/3 objects at 5 minutes. The remainder of the neurological exam shows no abnormalities. Which of the following is the most likely diagnosis?

Answer Choices:

- A. Transient global amnesia
- B. Depersonalization/derealization disorder
- C. Seizure
- D. Migraine

Reasoning + Answer:

<think> Considering the symptoms of the patient , such as difficulty in recalling recent events , confusion about her surroundings , difficulty recalling short-term information , and a medical history of depression and migraines . These symptoms suggest Temporal factors interference in brain functions responsible for pathology . Moreover results her most likely diagnosis with question mark explanation Ass inged </think><answer> none -of -the -above Listed This deduced Evidence operates Fine normalization (ANSWER]
