

**Question:**

The feedback loop in men which regulates the production of sex hormones includes all but which of the following?

Answer Choices:

- A. follicle-stimulating hormone
- B. oxytocin
- C. pituitary gland
- D. hypothalamus
- E. gonadotropin-releasing hormone
- F. luteinizing hormone
- G. testosterone

**Reasoning + Answer:**

<think>

- The feedback loop in men regulating sex hormone production involves the hypothalamus releasing gonadotropin-releasing hormone, which then signals the pituitary gland to release luteinizing hormone and follicle-stimulating hormone. Luteinizing hormone acts on the testes to produce testosterone, which provides feedback to the hypothalamus and pituitary gland.
- Oxytocin is not directly involved in this feedback loop for sex hormone regulation.
- Testosterone is the primary male sex hormone produced in this process but is not a component of the feedback loop itself.

Answer> B. oxytocin

(answer not in choices, most relevant non-component is G. testosterone, but strictly based on answer options, B. oxytocin is the correct choice as it's not part of this feedback loop)
